FARM2FLAVOUR

A shop that takes orders from the phone

Home delivery for a small shop. Customers order in an Android app. The shop runs the day from a website. Drivers can use a second phone app.

5 November 2026

THE PRODUCT

Three tools, one shop

TOOL	WHO	WHERE
Customer app	People who order	Android phone
Admin panel	Owner and shop staff	Website, laptop or phone
Delivery app	Staff on the road	Android phone, optional

They share one database. A new order shows in the admin panel as soon as the customer places it. A status change in the admin panel shows in the customer app, with the date and time.

ONE PRODUCT, ANY SHOP

The app wears the shop’s name

The customer app is not locked to one logo drawn into the software.

- **Name, phone, address, and description** come from **Profile**.
- **Logo** is on the sign-in screen and on the delivery bill.
- **Welcome photo** is the wide picture on the sign-in screen only.
- **Home posters** are separate. They are set under **Announcements**.
- **Products, prices, and categories** come from the admin panel.

The phone’s home-screen icon is part of the installed app. A new icon needs a new install.

THE ORDER

From browse to paid

1. The customer browses and adds items.
2. They place the order. Status is **Placed**.
3. The shop confirms. Status is **Confirmed**.
4. The shop sends it out. Status is **Out for delivery**.
5. The shop marks it delivered. Status is **Delivered**.
6. The shop records **Cash** or **UPI**.

Each step keeps a date and time. The customer sees the same steps.

PAYMENT

Pay the person who delivers

There is no card payment inside the app.

- Customers pay **cash** or **UPI** at the door.
- Until the shop records that payment, a delivered order stays **Outstanding**.
- If the shop uploaded a UPI code, the customer can see it when the order is on the way and not yet paid.
- If a paid order is cancelled, it becomes **Refund pending** until the shop marks the money returned.

CUSTOMER APP

How a customer gets in

- A new visit shows the welcome screen: logo, shop name, description, and the welcome photo if one is set.
- They tap **Continue with Google**. There is no password.
- Someone who already ordered with a mobile number can prove that number with a text code. Google is then linked to the same account, so earlier orders stay put.
- They can **Skip** and look at products first. Sign-in is required to save an address, open orders, or place an order.
- Someone who is already signed in opens straight on Home.
- A Google sign-in stores the name and email. The Customers list gets a row only after a mobile number is confirmed.

CUSTOMER APP

Home, then a full search screen

Browsing, top to bottom

- Delivery address, and a round initial that opens Account.
- Search.
- Category chips, fixed under search, when categories are turned on.
- Home posters, a wide strip under the categories. More than one poster moves on its own.
- Products, two per row, with Add, then plus and minus.

Search

- Search fills the screen. A round back arrow sits beside the box.
- Categories stay and still filter the results.
- The posters hide so results have room, and they stay above the keyboard.
- Back clears the search and returns to Home.

CUSTOMER APP

Posters and a closed shop

Posters

- Shown only when Announcements are turned on.
- Up to 8. The shop crops each photo to the same wide frame the phone uses.
- A phone alert is sent only for a poster the shop switches on at publish time. The switch turns off after save, so a later save does not send it again.

Shop closed

- The home screen and the cart show the shop’s message.
- **Place order** is not available.
- An order that is already placed can still be updated.
- The shop can still type a phone or walk-in order on the website.

CUSTOMER APP

The cart

- Address at the top. Tap it to change where this order goes.
- Up to **15 different products**, and up to **10 of each**.
- Clear cart asks before it empties the cart.
- The bill shows the total and **Pay on delivery · Cash or UPI**.
- The phone must be online to place the order.
- If a product became Coming soon after it was added, the customer has to remove it first.

CUSTOMER APP

One open order for one address

Each address can have only one **open** order. Open means Placed or Confirmed.

- A second order to that same address is offered as **View / Modify** on the order already there.
- A different saved address can have its own open order.
- A customer can save up to **3 addresses**.
- Once the first order is **Out for delivery**, a new order to that address is allowed.

CUSTOMER APP

Change it, cancel it, follow it

Change an open order

- Add, remove, or change quantities, then **Update order**.
- A customer can update one order at most **5 times**. Shop edits do not use up that count.
- After the shop edits items, the customer can open **View changes**.

Cancel

- The customer can cancel only while the order is still **Placed**, and at most **3 times in a day**.
- After the shop confirms, the customer calls the shop. The shop can still cancel, and must give a reason.

Follow

- Your Orders shows the status. The order screen shows the number, items, address, and each step with its time.

CUSTOMER APP

Coming soon, and order again

- **Inactive** products are hidden.
- **Coming soon** products stay visible, dimmed, and cannot be added. **Notify me** asks for a phone alert when that item can be ordered.
- **Order again** lists products from the customer’s recent orders, not from cancelled ones, so a usual order is quick to repeat.
- Tapping a product picture does not open a separate product page. The name, price, and Add button are on the card.

ADMIN PANEL

The shop's website

Staff sign in with email and password. A customer sign-in cannot open the shop website.

Menu

Dashboard, Orders, Reports, Audit log, Products, Customers, Profile, Announcements, Shop status.

A normal day

- Dashboard: orders today, sales today, delivered today, and money still outstanding.
- If orders are still Placed, a banner counts them and opens that list.
- Confirm, send out, mark delivered, then record Cash, UPI, or Not yet.
- A wrong status can be corrected. A cancellation needs a reason.
- Reports lists who still owes money. "Today" uses India time.

ADMIN PANEL

Products and customers

Products

- Add a photo, name, and price. Active and available means the customer can buy it.
- Categories are optional. Customers see them as chips under search.
- A spreadsheet import handles up to 250 products at a time.
- A product that was already ordered is not deleted. Mark it Inactive to hide it.

Customers

- A customer appears here after a mobile number is confirmed. Staff can also add a phone or walk-in customer. A Google-only sign-in stays on the orders, not in this list, until that number is confirmed.
- Up to 3 addresses, plus delivery notes the customer does not type themselves.
- Communities group addresses for the shop only. Customers never see the community name.

ADMIN PANEL

Profile, posters, and shop status

Profile

- Logo, welcome photo, name, phone, email, and address.
- Save prints those details on the next delivery bill.
- The welcome photo is only for the sign-in screen.

Announcements

- Crop each poster in the wide frame. Publish to show it under the categories.
- Phone alert is off until the shop turns it on for that poster.

Shop status

- Open: customers can place orders.
- Closed: new customer orders stop, with the message the shop writes.

DELIVERY APP

The delivery phone

Same email and password as the website. Not a customer sign-in.

- **To deliver** shows what is still Placed, Confirmed, or on the way.
- Swipe through confirm, start delivery, and mark delivered.
- At the door, record Cash, UPI, or Not yet.
- After a delivery, the phone can share a one-page invoice on WhatsApp. The file name is the shop name and the order number. The app does not send it by itself.
- The bill uses the logo, phone, email, and address from Profile.
- If the website already marked the order delivered, the phone does not deliver it a second time. Staff can still record payment.

NOTIFICATIONS

What reaches the phone

Only people who installed the app and allowed notifications.

- The order is confirmed, sent out, or delivered.
- A Coming soon item they tapped **Notify me** on is ready.
- A poster whose **Phone alert** was on when the shop published.

The shop's WhatsApp contact list is not the same as this. The app cannot text that list.

OUT OF SCOPE

What this version does not do

- No voice ordering, and no microphone permission.
- No card or in-app payment.
- No separate product page.
- No customer-typed delivery instructions. The shop can store those on the address.
- The delivery app is not on the Play Store. Staff install that app directly.
- The customer app’s store listing is still a release step, not something this deck treats as already live.

SAFETY

How access is kept in bounds

- Customers sign in with Google and see their own orders. A text code is used only to prove a mobile number that already has orders, and that links Google to the same account.
- Shop staff use an admin login. Anyone else is turned away.
- A closed shop is enforced in the database, including on an older installed app.
- Posters, the logo, and the welcome photo have to be pictures uploaded for this shop.
- Shop photos and the UPI code are public on purpose, so customers can see them.
- The app does not ask for the microphone.

FOR A TECHNICAL LISTENER

Where it lives

PIECE	ROLE
Customer app	Expo Android app. Talks to the database with the public client key.
Admin panel	Website. Staff actions run only after an admin sign-in.
Delivery app	Expo Android app. Same admin login as the website.
Database	Shared shop data, order rules, and file storage.
Google sign-in	Customer sign-in. The app never holds the Google secret.
Text codes	Used only when a customer proves a mobile number that already has orders. A practice number can use a fixed code and does not send a real text.

Push alerts are sent by the server, not by the phone app holding a master key.

CHECKING THE PRODUCT

What we tell people to try

The tester sheet is `docs/qa-test-cases.xlsx`. It is written for shop staff, not for engineers.

- Start at Step 1, admin sign-in.
- Do every must-pass row before a launch.
- Step 61 is one real order from the customer through payment.
- Newer rows cover posters, a phone alert, closing the shop, search, and the missing microphone.

The business guide and the technical guide are the long form of this deck.

KEEP IT TRUE

When the product changes, update this deck

This presentation is part of the project docs. It should describe what a customer and the shop can do today.

1. Edit `docs/presentation.md` in the same change as the feature.
2. Run `npm run docs:presentation`.
3. Open `docs/pdf/Project-Presentation.pptx` in PowerPoint or Keynote.

Speaker notes are saved on each slide. The HTML copy is for a browser: arrow keys move, **N** shows notes, **F** fills the screen.

Update the deck when someone would see or do something new: a screen, a rule, a menu, or a removed feature. A version number by itself does not need a new slide.
